

#### Data Class:

I have observed the class `Dimenesions.java` has just only getters and setters method. This is mentioned in the lecture code smells part 1 2.3.7 Code smells. The data is being modified is `Add/Edititemactivity` class, this setter can be better placed in that classes rather than having a seperate class.

#### Duplicated Code:

Mentioned in the lecture code smells part 2.3.7 lecture. The problem here both `Add item activity` and `edit item activity` have common classes like `onCreate` and `saveContact`, where `edit` has an additional one, the solution would be use having only class one class with those method combined and have an extract method and place calls for the new methods in both places.
